ABSTRACT

The purpose of this study was to establish a reliable method for the quantification of retinoic acids in biological samples based on the characteristic value of retinoic acid, which was previously published in the literature. This method was validated by comparing it with the previously published method. The results indicate that the proposed method is reliable and can be used for the quantification of retinoic acid in biological samples.

RESULTS AND DISCUSSION

The results of the study were analyzed using a statistical software program. The data were found to be normally distributed and the results were found to be statistically significant. The proposed method was found to be more accurate and precise than the previously published method. The results also indicate that the method is applicable to a variety of biological samples.

SUMMARY

The proposed method is a reliable and accurate method for the quantification of retinoic acids in biological samples. The results indicate that the method is applicable to a variety of biological samples and can be used for the quantification of retinoic acid in biological samples.
